## Model 1000

Turbo Windtunnel is a scale down wind machine from Hollywood studios. Whenever you need artificial wind to create some mood in your photos or videos, turbo windtunnel can do what a ordinary house hold fan just could not do. The tunnel casing shapes like a jet engine so it concentrates the wind like a spot light. Model 1000 has a manual control for 5 wind speeds. It also has an auto mode that makes the wind speed up to full strength and slow down to spring breeze at selected time frame. The control panel is detachable to mount on the bracket, to be beamed by infra-red wireless remote control that comes with the unit. Turbo Windtunnel can mount on any light stand which has a standard 5/8in spigots. Stand is not included.

## Model 500

Model 500 is made exactly like the model 1000 but it does not have a detachable control panel, or an automatic speed control function. Also, an infra-red wireless remote is not available for it. However, it has a stepless wind speed control so that the user can precisely control the desired wind speed. Turbo Windtunnel is relatively a quiet machine for the large amount of wind that it generates. So, when you are working with fashion models, the machine will not generate nuisance noise to overcome your background music which models need to swing with in-front of your cameras or video camcorders. Stand is not included but you will find the Turbo Windtunnel can easily fit onto your existing lightstands that you already have in your studio. Have fun with it !

**Turbo Windtunnel** is also a beautiful piece of decorative furniture in your studio to impress customers !
